Hall effect in ferromagnetic metals near the Curie point TITLE: भ,44,53 SOURCE: Fizika metallov i metallovedeniye, v. 20, no. 3, 1965, 355-360 TOPIC TAGS: ferromagnetic material, Curie point, nonferrous metal, Hall constant, nickel base alloy, molybdenum containing alloy 44,55,727 ABSTRACT: The dependence of the Hall field on the true magnetization of ferromagnetic materials was investigated theoretically by Ye. I. Kondorskiy (ZhETF) 1965, 48, 506). Experimentally, the Hall effect was studied in Ni-Mo alloys (≦5 atom% Mo) near the Curie point in a magnetic field, where the magnetisation of samples was controlled mostly by true magnetization. The experiments showed that (1) the anomalous Hall field was proportional to true magnetization; (2) the constant  $R_1$ , describing the Hall field in the region of true magnetization, had an absolute value higher than the Hall spontaneous constant  $R_3$ , i.e.  $|R_1|>|R_3|$ ; (3) the  $R_1$  and the spontaneous magnetization  $I_3$  were related Card\_1/3 0901 0250

TITLE: Hall effect in the paraprocess region

SOURCE: Moscow. Univesitet. Vestnik. Seriya III. Fizika, astronomiya,

no. 5, 1965, 24-27

21,44,55 TOPIC TAGS: Hall effect, nickel base alloy, molybdenum containing alloy, si-27 licon containing alloy, electromotive force, Hall constant

ABSTRACT: Results on the measuring of the Hall electromotive force (E) in the paraprocess region (i.e. above the technical saturation), were given as the function of magnetization. The study was made with ferromagnetic Ni-Mo and Ni-Si alloys in the temperature range from room to the Curie point. The studied Ni-base alloys contained: (1) 1.2% Mo, 2.5% Mo, 3.8% Mo, and (2) 2.0% Si, 5.5% Si, and 7.3% Si. The Hall electromotive force was measured according to the I. K. Kikoin method (Phys. Zeitschrift der Sow., 9, 1, 1936.) It was proportional to the true magnetization I: E=E-E =R<sub>1</sub>I<sub>1</sub>; where E = (R<sub>B</sub>-R<sub>1</sub>)I was

constant at a given temperature and determinable by the section in the graph corresponding to the Hall electromotive force at I2); R and R were the Hall constants corresponding to the technical magnetization and the paraprocess, region, respectively. The Hall constant R, corresponding to the paraprocess, was determined and its values were compared to those determined during experiments from the graph E(I). The quantitative agreement in the walues of the R constant, determined by various by thods, proved the accuracy of the initial e equation used for determining R: E= RI+RI; where I=I-I. The author thanks D. I. Volkov and E. I. Kondorskii for advice during the work and for assistance in the interpretation of results. Orig. art. has: 5 formulas, 3 figures, and 1 table.

Filled polymers. V. Introduction of aminated bentonite in

polycaprolactam

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 1, 1962, 95 - 97

TEXT: The authors studied the effect of highly disperse filler with modified surface (methyl-octadecyl-ammonium bentonite) (I) upon the physicomechanical properties of crystalline polycaprolactam. I was obtained according to I. A. Uskov (Vysokomolek. soyed., 2, 200, 1960). For producing a highly disperse powder of I, the benzene-containing or aqueous paste was dried by sublimation. Xerogel obtained in this way can be easily dispersed to a powder. In a 70% methanolic caprolactam solution, bentonite showed optimum dispersion. Methanol was removed by drying at 60°C. Polycondensation proceeded in evacuated ampuls or in a CO, stream

in the presence of 3% Ar(AG) salt and 5% adipic acid during 8 hr at 265°C. Card 1/4

32352 \$/190/62/004/001/014/020 B110/B101

Filled polymers. V. Introduction ...

Mixing of the aqueous bentonite paste with caprolactam yielded a homogeneous, filled polymer. In the present case, polycondensation of a mixture of filler and caprolactam separated from the methanolic, monomeric solution took place. Tabular samples were cut from cylindrical blocks and the monomer was washed out by 10-hr boiling in water. The following molecular weights were viscosimetrically determined from solutions in 40%  $\rm H_2SO_4$ :

Degree of bentonite amination	(4)			
in microequivalents per g	0	500	800	1000
Molecular weight of poly-	and the second s		And the second s	and the same of th
caprolactam, in thousands	21,4+1.4	21.4 <u>+</u> 3.5	24.8 <u>+</u> 1.6	30.8 <u>+</u> 1.6

The degree of polymerization of polycaprolactam is not reduced by introducing fillers. A small increase is caused by neutralizing adipic acid acting as stabilizer by binding with amine adsorbed on bentonite. The Card 2/4

32352

5/190/62/004/001/014/020

Filled polymers. V. Introduction ...

B110/B101

thermomechanical curves for pure and filled polycaprolactam completely coincided. This is in agreement with V. A. Kargin's and T. I. Sogolova's data (Ref. 6: Vysokomolek. soyed., 2, 1093, 1960). Dependence of hardness of polycaprolactam on the content of I having a degree of amination of 800 microequivalents/gram is:

Filler content. %	n	1	3	5	8
Hardness, kg/mm <sup>2</sup>	14.1	15.4	15.8	18.7	19.1

For the first 5%, the maximum increase in hardness caused by the active filler can be observed. Comparison between differently aminated I showed for 10% filler content:

Degree of amination,			
microequivalents/gram	500	800	1000
Hardness, kg/mm <sup>2</sup>	17.0	16.0	16.8
Card 3/4	· · · · · · · · · · · · · · · · · · ·		

32352 \$/190762/004/001/014/020 B110/B101

Filled polymers. V. Introduction ...

O. D. Kurilenko and R. V. Mikhalyuk (Ref. 7: Kolloidn. zh., 21, 195, 1959) found that low and high amination of bentonite led to a rise in heat of wetting with water. For maximum filler activity, not a completely hydrophobic but a somewhat polar surface is required. Aminated bentonite is an active filler of amorphous and crystalline polymers. There are 1 figure, 1 table, and 7 references: 5 Soviet and 2 non-Soviet. The two references to English-language publications read as follows: I. W. Iordan, F. F. Maleyev, J. Polymer Sci., 31, 301, 1958; A. J. Jurzhenko, J. Phys. Colloid, Sci., 53, 294, 1949.

Shevchenko (Kiyevskiy gosudarstvennyy universitet) TITLE: Effect of high frequency currents on the kinetics of the catalytic synthesis of ammonia SOURCE: Kinetika i kataliz, v. 7, no. 4, 1966, 747-749 TOPIC TAGS: catalysis, ammonia, high frequency furnace 1 ABSTRACT: The exposure of GK-1 commercial iron catalyst used in ammonia synthesis, to 580 and 693 KHz fields is discussed. During the initial period (4-5 hr), the reduction of the catalyst in a high frequency furnace at 350°C was much faster than in the case of ordinary heating; however, with time, this difference disappeared. Catalyst activity at 300°C was three times greater than that of the same catalyst heated in an ordinary furnace. With rising temperature, the effect of high frequency currents on the rate of catalytic formation of ammonia decreased and disappeared completely at 450--500°C. This was probably because the high frequency heating affects the activity of the iron catalyst only when the ammonia synthesis process is far from equilibrium. Orig. art. has: 2 tables. TOPIC TAGS: chemical reaction, polymerization, catalysis

TRANSIATION: The condensation telemerization of pentaerythrite and the following dicarboxylic acids: sebacic, adipic, and phtalic with an addition of methacrylic acid in a ratio of pentaerythrite to the acids 1:2:6.6 in the presence of 5% of dil. (1:10) H2504 as catalyst; or using n-tolucnesulfonic acid in a toluene, or benzene medium under continuous azeotropic distillation of the reaction water was carried out. Polyesteracrylates are a mixture of oligomeres with a degree of polycondensation n=2. At n=1 the ester number and the bromide number were determined. The hap was found. The polyesteracrylate was polymerized with 0.5% of benzoyl peroxide at 70° and 120° for 5 hrs. The physical-mechanical properties of polymers, such as hardness (Brinell), static bending strength and the weight loss at 240° in N2 atmosphere were determined. N. Nikolaenko

Kolloidnyy zhurcal, 1959, Nr 2, pp 216-220 (USSR)

ABSTRACT:

The authors carried out their experiments under the assumption that the contraction of the pore intervals of the gel structure of coke occurs under the action of capillary forces called forth during the heating process by the separation and volatilisation of substances, which fill the cells of the gel frame. The investigation has confirmed this conception of the contraction mechanism of the semicoke substance and of the role of the liquid phase in this process. The authors have shown the connection between the semicoke contraction process and the colloid structure of

tics than vertical hydraulic generators	s of the same unit	power due to hydraulic
and mechanical considerations. This a	rticle analyzes pro	blems of static and
lynamic stability of hydroelectric sta-	tions with capsule	generators, problems
of the selection of the most effective control of excitation. The installation	on of cansule gener	rators considerably hin-
ders provision of stability of paralle	l operation of stat	tions and reduces the
overall level of stability of combined	power systems. A	ll known methods of
increasing stability are as yet little	effective in this	case. The most effec-
tive, though very expensive, method for	r increasing stabil	lity is the usage of
controlled synchronous compensators.	The best compromise	for solving the en-
tire problem is the usage of high speed	d circuit breakers	and relays with over-
all operating times of under 0.06 second	nds. Orig. art. ha	as: b figures. [Jrio:

TITLE: Certain findings on the use of the asynchronous accumulation method in seismic prospecting

SOURCE: Moscow. Vsesoyuznyy nauchno-issledovatel'skiy institut geofizicheskikh meto-dov razvedki. Prikladnaya geofizika, no. 46, 1965, 21-33

TOPIC TAGS: seismic prospecting, hodograph, signal correlation

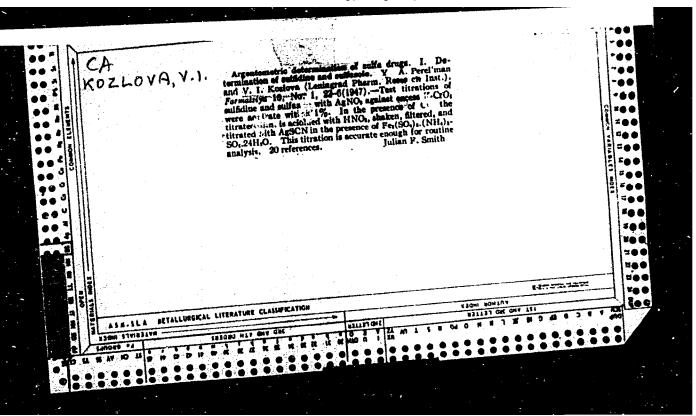

ABSTRACT: The paper discusses the first application on land of this method which has been used for prospecting at sea since 1959. The work was done in southwest Turkmenistan and was intended to test the applicability of the method under conditions typical of the Transcaspian region. The method was used in two variants. In the first, the signal is recorded in both correlating channels at the same time. In the other, there is a certain time lag between the recordings in the correlating channels. Instrumentation and procedures are briefly discussed. An immovation introduced in the procedure was to do all the shooting at permanent sites and to move the recorders around. The quantities of explosives used and the conditions of shots are tabulated. The quantities of explosives varied from 3 to 4000 kg and the distances between the shot and

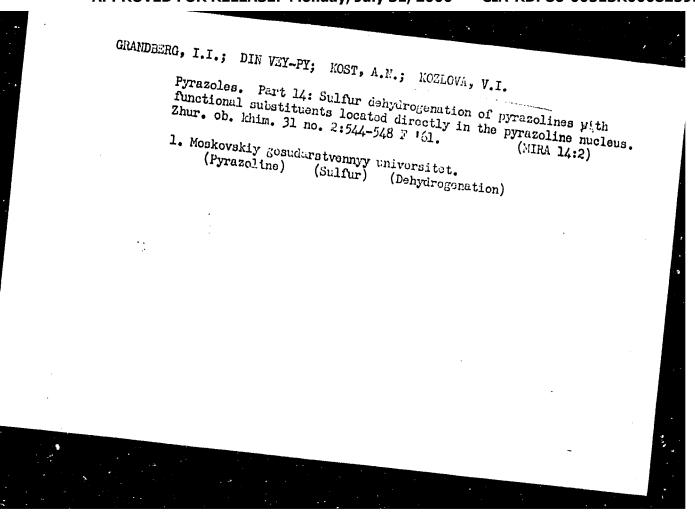

Card 1/2

CIA-RDP86-00513R000825910

the receivers varied from 8 to 322 km. In comparison with other seismic methods, the saving in explosives was from 25 to 33%. Traces of waves recorded by this method were sharper and wave velocities were somewhat greater. The criterion for identification of the useful signal is the periodicity of the function of mutual correlation. The results of this experimental work, which had to be abridged because of the climatic conditions, were encouraging. The authors conclude that the method is promising.  Orig. art. has: 6 figures. TITLE: Resistance of some strains of microorganisms to ultraviolet radiation

SOURCE: Mikrobiologiya, v. 35, no. 2, 1966, 302-306

TOPIC TAGS: UV radiation, radiation dosimetry, microbiology, astrobiology

ABSTRACT: As part of a program to discover microorganisms capable of withstanding the physical and chemical conditions characteristic of Mars? the authors performed experiments to: (1) find species resistant to ultraviolet radiation, (2) determine the dose that the individual species could tolerate, and (3) get some idea of the thickness of the screen needed to protect the cells from the destructive effect of the rays? Of the 28 strains investigated (Torula nigra, Bac. megaterium, Asp. niger, Asp. oryzae, Mucor plumbeus, Bac. simplex, Rhodotorula rubra, R. colostri, Tirotrix scaber, Bac. my oides, Bac. rubifaciens, Torulopsis glutinis, Bac. subtilis, Serratia marcescens, Flavobacterium aurantiacum, etc.), the nonpigmented spore forms of the bacteria and the nonspore-forming yeasts possessing intense red or black pigment were the most resistant to ultraviolet. The authors devises a way of obtaining monolayer bacterial preparations to study the penetrability of ultraviolet through the bacterial cells. A screen consisting of a single layer of Rhodotorula
